

Record 27 - Fairview General Hospital - Nephrology Consult Note

****Date of Service:**** 06/28/2026

****Provider:**** Dr. R. Castellanos, Nephrology

Reason for consult: Progressive rise in creatinine over the course of hospitalization, from a baseline of 0.9 on admission to 4.4 today, 18 days into this admission.

Review of daily labs throughout this admission shows a steady, essentially uninterrupted upward trend in creatinine from the day of admission onward, without evidence that this trend prompted nephrology consultation, a renal ultrasound, or a change in management until a renal ultrasound was obtained on day 16 and this consult today.

Assessment: Severe acute kidney injury, likely a combination of sepsis-related acute tubular injury and possible contribution from volume status changes over the admission. Given the current degree of renal impairment and associated symptoms, initiation of renal replacement therapy is recommended.

Plan: Begin hemodialysis today. Nephrology to follow daily during remainder of admission.
