

### Record 6 - St. Adeline Medical Center - Emergency Department Note

\*\*Date of Service:\*\* 01/21/2025

\*\*Provider:\*\* Dr. K. Ibrahim, Emergency Medicine

Chief complaint: Acute shortness of breath, arrived via EMS.

HPI: 63-year-old female, s/p right TKA on 01/06/2025, presents with acute-onset severe shortness of breath and right-sided chest pain that began approximately 2 hours prior to arrival. Patient reports several days of worsening exertional dyspnea and persistent right calf discomfort since her prior surgery, which she had reported to her physical therapist and, less specifically, to her PCP.

Vitals: HR 128, BP 102/68, RR 28, SpO2 89% on room air, Temp 98.9F.

Exam: Tachycardic, tachypneic, mild hypoxia. Right calf with mild swelling and tenderness. No edema on left.

CT angiogram chest: Bilateral pulmonary emboli, moderate clot burden, no evidence of right heart strain at this time.

Assessment: Acute bilateral pulmonary embolism, likely secondary to right lower extremity DVT in the setting of recent TKA and known Factor V Leiden mutation.

Plan: Admit to ICU. Start IV unfractionated heparin drip. Hematology and cardiology consults placed.
