

Record 7 - St. Adeline Medical Center - ICU Admission / Hematology Consult Note

****Date of Service:**** 01/22/2025

****Provider:**** Dr. S. Whitfield, Hematology

Consulted for management of acute PE in patient with known heterozygous Factor V Leiden mutation (documented 12/18/2024 pre-op hematology clearance). Patient's post-operative DVT prophylaxis (enoxaparin 40mg daily) was a standard prophylactic dose; given her known thrombophilia, a higher index of suspicion for VTE was warranted with her reported symptoms of dyspnea and persistent calf discomfort in the two weeks following surgery.

Currently on IV heparin drip, therapeutic PTT achieved as of this morning. Plan to transition to oral apixaban 10mg twice daily for 7 days, then 5mg twice daily thereafter, once stable for discharge.
