

Record 7 - Overlake Regional Medical Center - Discharge Summary

****Date of Service:**** 05/19/2026

Discharge diagnosis: Upper GI bleed secondary to supratherapeutic INR from a warfarin dosing error (10mg administered vs. 5mg ordered), duodenal ulcer with successful endoscopic hemostasis.

Hospital course: 5-day admission, transfused 2 units PRBC, reversed anticoagulation, endoscopic treatment of bleeding ulcer, hemoglobin stable at discharge (10.9).

Discharge medications: Apixaban 5mg PO BID (switched from warfarin given the dosing/monitoring complexity). Medication list reviewed line-by-line with patient and home health agency contacted to correct prior administration error.

Follow-up: Cardiology in 1 week, GI in 4 weeks, repeat hemoglobin check in 1 week via primary care.
