

Record 1 - Meridian Occupational Health - Initial Visit

****Date of Service:**** 02/03/2026

****Provider:**** Dr. A. Kowalski, DO

Patient presents after a fall at work yesterday, landing on outstretched right arm. Reports right shoulder pain, worse with overhead reaching. Denies numbness/tingling in the hand.

Past medical history notable for hypertension, well-controlled on lisinopril. Patient mentions he had his gallbladder removed "a few years back" without complication.

ROS: denies fever, chest pain, shortness of breath. Reports occasional low back stiffness, longstanding.

Physical exam:

Right shoulder: tenderness over lateral deltoid, painful arc of abduction 60-120 degrees, weakness with resisted external rotation. Neurovascularly intact distally.

Assessment: Right shoulder strain, rule out rotator cuff injury.

Plan: Conservative management for 2 weeks - NSAIDs, activity modification. Refer to physical therapy. If no improvement, will order MRI. Follow up in 2 weeks.

Prescriptions Written Today: Meloxicam 15mg PO once daily for 14 days.
