

Record 3 - Cascade Physical Therapy - Progress Note

****Date of Service:**** 02/24/2026

****Provider:**** Melissa Tran, PT, DPT

Patient completed 4 PT visits. Reports minimal improvement in overhead function, pain persists at 6-7/10 with overhead reaching. Strength testing today: 4-/5 resisted external rotation with pain, 4/5 resisted abduction with pain, both notably weaker than typical strain presentation at this stage of treatment.

Assessment: Persistent impingement symptoms, poor response to 4 visits of conservative PT. Weakness on manual muscle testing raises concern for a structural rotator cuff tear rather than simple strain/impingement alone.

Plan: Recommend patient return to referring provider to discuss advancing workup (MRI) given lack of expected progress with conservative care. Will continue PT in the meantime.
