

Record 7 - Meridian Occupational Health - Follow-Up Visit

Date of Service: 04/09/2026

Provider: Dr. A. Kowalski, DO

Patient returns to review MRI results. Findings discussed - full-thickness rotator cuff tear. Patient reports continued significant functional limitation, unable to perform overhead lifting required for his job duties.

Patient mentions his father had "some kind of shoulder surgery" years ago, unclear on details.

Assessment: Full-thickness right supraspinatus tear, confirmed by MRI, approximately 9 weeks after initial injury and symptom onset.

Plan: Referral to orthopedic surgery for evaluation and likely surgical repair given full-thickness tear and failure of conservative management. Continue current activity restrictions.
