

Record 10 - Alpine Orthopedic Surgery - Post-Operative Follow-Up

****Date of Service:**** 06/02/2026

****Provider:**** Dr. R. Whitfield, MD

Patient 3 weeks status post right rotator cuff repair. Incisions healing well. Reports pain improving, currently in sling per protocol.

Discussed with patient that given the moderate retraction and fatty infiltration found at surgery - findings consistent with a tear that had been present for some time prior to repair - his ultimate recovery and strength may be somewhat more limited than would be expected from a more acute repair.

Plan: Begin post-operative physical therapy per protocol. Continue sling per surgeon instructions. Follow up in 6 weeks.
